

Product description

The Banque de France provides other banks and financial organizations with financial information on companies and private individuals. **FCC, FNCI, FICP and FIBEN** are accessible via videotex or telex and, in the future, via the Banque de France extranet. **FIBORD** provides FIBEN data via an X25 closed user group and allows:

- integration into your IT systems.
- instantaneous response time.
- reduced costs.

SYNAPSE ✓ **BdF**
integrates Banque de France data into your applications or your workstations.

SysperTec offers two gateways for accessing and integrating Banque de France data:

- **VirNT**, solution for WindowsNT with videotex emulation by **Pletor'x** or **Synapse/NT**.

- **VIRTEL**, solution for S/390 MVS or VSE . With **Pletor'x** and/or **SYNAPSE/CICS**.

Integration and interfaces

Integration into your applications:

Requests can be submitted:

- by **writing a record** into a file in a suitable **format** containing the name of the requested service, a priority level, and variable data.
- by **API or interfaces** (MQSeries, VirPass) which allow the record to be placed in the same file.

SYNAPSE places the response in another file and starts a customer-defined program (print, extract, decode,...). FIBORD, with its structured data, is the best solution for integration.

Data entry and enquiry interface:

Videotex emulation allows interactive access via Pascam or Lecam for authentication.

SYNAPSE offers a user interface (3270, windows or **HTML**) which allows **optimized**, centralized and secured interactive access

SYNAPSE comprises:

- A **queue manager** (GFA) which processes requests according to priority and time-of-day constraints.
- A **Workload Distribution Manager** which establishes N logical channels with remote servers.
- **Script programs** which string together sequences of actions to retrieve the desired information.

Productivity, cost-savings

SYNAPSE cuts your bills and improves the productivity of your users.

The figures: 4 seconds authentication via Pascam, 18 via Lecam, 45 on a Minitel/Lecam (and 0 for FIBORD).

An interactive FCC enquiry can take from 1 to 2 minutes, while Synapse can do it in 2 to 6 seconds. A FIBEN module via FIBORD takes 1 to 2 seconds, costs 10 to 30 % less than videotex and can be easily integrated into your data.

SYNAPSE provides:

- Detailed statistical information.
- **Security interface:** manages resources, profiles, users, and groups. Only those modules authorized are presented to the user.
- **Grouped printouts** of captured pages.
- Trace tools, console messages.
- Scripts for Banque de France, Infogreffe, CNP (Caisse Nationale de Prévoyance, ORT, D&B, directories, etc...)

Millions of BdF enquiries are processed each month via Synapse which adapts to new technologies and incorporates the specifics of the BdF IP gateway.
